TABLE OF CONTENTS

FOREWORD	xiii
PREFACE	xvii
Chapter 1	
SEISMIC DESIGN PRINCIPLES IN STRUCTURAL CODES	1
1.1 Introduction	1
1.2 Fundamentals of seismic design	2
1.2.1 Capacity design	2
1.2.2 Seismic design concepts	6
1.3 Codification of seismic design	11
1.3.1 Evolution of seismic design codes	11
1.3.2 New perspectives and trends in seismic codification	19
Chapter 2	
EN 1998-1: GENERAL AND MATERIAL INDEPENDENT PARTS	25
2.1 Introduction	25
2.2 Performance requirements and compliance criteria	27
2.2.1 Fundamental requirements	27
2.2.2 Ultimate limit state	32
2.2.3 Damage limitation state	34
2.2.4 Specific measures	35
2.3 Seismic action	36
2.3.1 The fundamentals of the dynamic model	36
2.3.2 Basic representation of the seismic action	40
2.3.3 The seismic action according to EN 1998-1	46
2.3.4 Alternative representations of the seismic action	52
2.3.5 Design spectrum for elastic analysis	54
2.3.6 Combinations of the seismic action with other types of actions	56
2.4 Characteristics of earthquake resistant buildings	58
2.4.1 Basic principles of conceptual design	58
2.4.2 Primary and secondary seismic members	60

TABLE OF CONTENTS

2.4.3	Criteria for structural regularity	61
2.5	Methods of structural seismic analysis	70
2.5.1	Introduction	70
2.5.2	Lateral force method	72
2.5.3	Linear modal response spectrum analysis	75
2.5.4	Nonlinear static pushover analysis	84
2.5.5	Nonlinear time-history dynamic analysis	90
2.6	Structural modelling	94
2.6.1	Introduction	94
2.6.2	Modelling of masses	96
2.6.3	Modelling of damping	98
2.6.4	Modelling of structural mechanical properties	101
2.7	Accidental torsional effects	107
2.7.1	Accidental eccentricity	107
2.7.2	Accidental torsional effects in the lateral force method of analysis	109
2.7.3	Accidental torsional effects in modal response spectrum analysis	110
2.7.4	Accidental torsional effects in nonlinear static pushover analysis	111
2.7.5	Accidental torsional effects in linear and nonlinear dynamic time history analysis	114
2.8	Combination of effects induced by different components of the seismic action	114
2.9	Calculation of structural displacements	117
2.10	Second order effects in seismic linear elastic analysis	118
2.11	Design verifications	121
2.11.1	Safety verifications	121
2.11.2	Damage limitation	126
 Chapter 3		
EN 1998-1: DESIGN PROVISIONS FOR STEEL STRUCTURES		129
3.1	Design concepts for steel buildings	129
3.2	Requirements for steel mechanical properties	133
3.2.1	Strength and ductility	133
3.2.2	Toughness	135

3.3	Structural typologies and behaviour factors	137
3.3.1	Structural types	137
3.3.2	Behaviour factors	141
3.4	Design criteria and detailing rules for dissipative structural behaviour common to all structural types	145
3.4.1	Introduction	145
3.4.2	Design rules for cross sections in dissipative members	145
3.4.3	Design rules for non-dissipative connections	147
3.4.4	Design rules and requirements for dissipative connections	148
3.4.5	Design rules and requirements for non-dissipative members	148
3.5	Design criteria and detailing rules for moment resisting frames	149
3.5.1	Code requirements for beams	149
3.5.2	Code requirements for columns	152
3.5.3	Code requirements for beam-to-column joints	153
3.6	Design criteria and detailing rules for concentrically braced frames	158
3.6.1	Code requirements for braces	158
3.6.2	Code requirements for beams and columns	162
3.7	Design criteria and detailing rules for eccentrically braced frames	164
3.7.1	Code requirements for seismic links	164
3.7.2	Code requirements for members not containing seismic links	171
3.7.3	Code requirements for connections of the seismic links	172

Chapter 4

DESIGN RECOMMENDATIONS FOR DUCTILE DETAILS		173
4.1	Introduction	173
4.2	Seismic design and detailing of composite steel-concrete slabs	174
4.3	Ductile details for moment resisting frames	182
4.3.1	Detailing of beams	182
4.3.2	Detailing of beam-to-column joints	186
4.3.3	Detailing of column bases	210
4.4	Ductile details for concentrically braced frames	215
4.4.1	Introduction	215
4.4.2	Detailing of brace-to-beam/column joints	216
4.4.3	Detailing of brace-to-beam midspan connections	228
4.4.4	Detailing of brace-to-brace connections	230
4.4.5	Detailing of brace-to-column base connections	235

TABLE OF CONTENTS

4.4.6	Optimal slope, constructional tolerances and local details for braces	236
4.5	Ductile details for eccentrically braced frames	239
4.5.1	Detailing of links	239
4.5.2	Detailing of link lateral torsional restraints	241
4.5.3	Detailing of diagonal brace-to-link connections	244
4.5.4	Detailing of link-to-column connections	245

Chapter 5

DESIGN ASSISTED BY TESTING **247**

5.1	Introduction	247
5.2	Design assisted by testing according to EN 1990	248
5.2.1	Introduction	248
5.2.2	General overview of EN 1990	250
5.2.3	Testing	252
5.2.4	Derivation of design values	254
5.3	Testing of seismic components and devices	262
5.3.1	Introduction	262
5.3.2	Quasi-static monotonic and cyclic testing	262
5.3.3	Pseudo-dynamic testing	275
5.3.4	Dynamic testing	277
5.4	Application: experimental qualification of buckling restrained braces	278
5.4.1	Introduction and scope	278
5.4.2	Test specifications	279
5.4.3	Test specimens	280
5.4.4	Test setup and loading protocol for ITT	280
5.4.5	Results	281
5.4.6	Fabrication Production Control tests	283

Chapter 6

MULTI-STOREY BUILDING WITH MOMENT RESISTING FRAMES **285**

6.1	Building description and design assumptions	285
6.1.1	Building description	285
6.1.2	Normative references	287
6.1.3	Materials	288

6.1.4	Actions	289
6.1.5	Pre-design	292
6.2	Structural analysis and calculation models	293
6.2.1	General features	293
6.2.2	Modelling assumptions	296
6.2.3	Numerical models and method of analysis	297
6.2.4	Imperfections for global analysis of frames	301
6.2.5	Frame stability and second order effects	303
6.3	Design and verification of structural members	304
6.3.1	Design and verification of beams	304
6.3.2	Design and verification of columns	310
6.3.3	Panel zone of beam-to-column joints	316
6.4	Damage limitation	319
6.5	Pushover analysis and assessment of seismic performance	320
6.5.1	Introduction	320
6.5.2	Modelling assumptions	321
6.5.3	Pushover analysis	328
6.5.4	Transformation to an equivalent SDOF system	331
6.5.5	Evaluation of the seismic demand	333
6.5.6	Evaluation of the structural performance	334

Chapter 7

MULTI-STOREY BUILDING WITH CONCENTRICALLY BRACED		
FRAMES		335
7.1	Building description and design assumptions	335
7.1.1	Building description	335
7.1.2	Normative references	337
7.1.3	Materials	337
7.1.4	Actions	338
7.1.5	Pre-design	340
7.2	Structural analysis and calculation models	342
7.2.1	General features	342
7.2.2	Modelling assumptions	342
7.2.3	Numerical models and method of analysis	344
7.2.4	Imperfections for global analysis of frames	348
7.2.5	Frame stability and second order effects	349

TABLE OF CONTENTS

7.3	Design and verification of structural members	350
7.3.1	Design and verification of X-CBFs	350
7.3.2	Design and verification of inverted V-CBFs	357
7.4	Damage limitation	365

Chapter 8

MULTI-STOREY BUILDING WITH ECCENTRICALLY BRACED

FRAMES 369

8.1	Building description and design assumptions	369
8.1.1	Building description	369
8.1.2	Normative references	371
8.1.3	Materials	371
8.1.4	Actions	372
8.2	Structural analysis and calculation models	374
8.2.1	General features	374
8.2.2	Modelling assumptions	375
8.2.3	Numerical models and method of analysis	376
8.2.4	Imperfections for global analysis of frames	380
8.2.5	Frame stability and second order effects	380
8.3	Design and verification of structural members	381
8.3.1	Design and verification of shear links	381
8.3.2	Design and verification of beam segments outside the link	384
8.3.3	Design and verification of braces	384
8.3.4	Design and verification of columns	385
8.4	Damage limitation	388

Chapter 9

CASE STUDIES 391

9.1	Introduction	391
9.2	The Bucharest Tower Centre International	393
9.2.1	General description	393
9.2.2	Design considerations	397
9.2.3	Detailing	421
9.2.4	Construction	422
9.3	Single storey Industrial Warehouse in Bucharest	432
9.3.1	General description	432

9.3.2	Design considerations	435
9.4	The Fire Station of Naples	449
9.4.1	General description	449
9.4.2	Design considerations and constructional details	456
9.4.3	The anti-seismic devices	467
REFERENCES		475

FOREWORD

There are many seismic areas in Europe. As times goes by, regional seismicity is better known and the number of places where earthquake is an action to consider in design increases. Of course, there are substantial differences in earthquake intensity between regions and the concern is much greater in many areas of Italy, for instance, than in most places in Northern Europe. However, even in Northern Europe, for structures for which a greater level of safety is required, like Seveso industrial plants, hospitals and public safety facilities, seismic design can be the most requiring design condition.

Designing for earthquake has original features in comparison with design for classical loading like gravity, wind or snow. The reference event for Ultimate Limit State seismic design is rare enough for an allowance to permanent deformations and structural damages, as long as people's life is not endangered. This means that plastic deformations are allowed at ULS, so that the design target becomes a global plastic mechanism. To be safe, the latter requires many precautions, on global proportions of structures and on local detailing. The seismic design concepts are completely original in comparison to static design. Of course, designing for a totally elastic behaviour even under the strongest earthquake remains possible but, outside of low seismicity areas, this option is generally left aside because of its cost.

xiii

This book is developed with a constant reference to Eurocode 8 or EN 1998-1:2004; it follows the organization of that code and provides detailed explanations in support of its rather dry expression. Of course, there are many other seismic design codes, but it must be stressed that there is nowadays a strong common thinking on the principles and the application rules in seismic design so that this book is also a support for the understanding of other continents codes.

Chapter 1 explains the principles of seismic design and their evolution throughout time, in particular the meaning, goals and conditions set forward by capacity design of structures and their components, a fundamental aspect of seismic design.

Chapter 2 explains the general aspects of seismic design: seismic actions, design parameters related to the shape of buildings, models for the analysis, safety verifications. Methods of analysis are explained in an exhaustive way: theoretical background, justifications of limits and factors introduced by the code, interest and drawbacks of each method, together with occasionally some tricks to facilitate model making and combination of load cases.

Chapter 3 focuses on design provisions specific to steel structures: ductility classes, requirements on steel material, structural typologies and design conditions related to each of them; an original insight on design for reparability is also included.

Chapter 4 provides an overview about the best practice to implement the requirements and design rules for ductile details, particularly for connections in moment resisting frames (MRF), concentrically braced frames (CBF) and eccentrically braced frames (EBF), and for other structural components like diaphragms.

Chapter 5 describes the guidance provided for design assisted by testing by EN 1990 and the specific rules for tests, a necessary tool for evaluating the performance characteristics of structural typologies and components in the plastic field and in cyclic/dynamic conditions.

xiv

Chapter 6 illustrates and discusses the design steps and verifications required by EN 1998-1 for a multi-storey Moment Resisting Frame.

Chapter 7 and 8 do the same respectively for buildings with CBF's and EBF's.

Chapter 9 presents three very different examples of real buildings erected in high seismicity regions: one tall building, one industrial hall and one design using base isolation. These examples are complete in the sense that they show the total design, where seismic aspects are only one part of the problem. These examples are concrete, because they illustrate practical difficulties of the real world with materials, execution, positioning...

The concepts, design procedures and detailing in seismic design may seem complex. This publication explains the background behind the rules, which

clarify their objectives. Details on the design of the different building typologies are given, with reference to international practice and to recent research results. Finally, design examples and real case studies set out the design process in a logical manner, giving practical and helpful advice.

This book will serve the structural engineering community in expanding the understanding and application of seismic design rules, and, in that way, constitute a precious tool for our societies safety.

André Plumier

Honorary Professor, University of Liege

PREFACE

This manual aims to provide its readers with the background and the explanation of the main aspects dealing with the seismic design of steel structures in Europe. Therefore, the book focuses on EN 1998-1 (usually named part 1 of Eurocode 8 or EC8-1) that is the Eurocode providing design rules and requirements for seismic design of building structures. After 10 years from its final issue, both the recent scientific findings and the design experience carried out in Europe highlight some criticisms. In the light of such considerations, this book complements the explanation of the EC8-1 provisions with the recent research findings, the requirements of renowned and updated international seismic codes (e.g. North American codes and design guidelines) as well as the design experience of the Authors. Although the manual is oriented to EC8-1, the book aims to clarify the scientific outcomes, the engineering and technological aspects rather than sticking to an aseptic explanation of each clause of the EC8-1. Indeed, as shown in Chapter 4, the proper detailing of steel structures is crucial to guarantee adequate ductility of seismic resistant structures and the current codes does not give exhaustive guidelines to design ductile details since it only provides the fundamental principles. In addition, the practice of earthquake engineering significantly varies between European regions, reflecting the different layouts of each national seismic code as well as the level of knowledge and confidence with steel structures of each country. With this regard, a large number of European engineers believe that steel structures can withstand severe earthquakes without requiring special details and specifications as conversely compulsory for other structural materials like reinforced concrete and masonry. This belief direct results from the mechanical features of the structural steel, which is a high performance material, being stronger than concrete but lighter (if comparing the weight of structural members) and also very ductile and capable of dissipating large amounts of energy through yielding when subjected to cyclic inelastic deformations. However, although the material behaviour is important, the ductility of steel alone is not enough to guarantee ductile structural response. Indeed, as demonstrated by severe past earthquakes (e.g. Northridge 1994,

Kobe 1995 and Christchurch 2011) there are several aspects ensuring good seismic behaviour of steel structures, which are related to (i) the conceptual design of the structure, (ii) the overall sizing of the member, (iii) the local detailing and (iv) proper technological requirements as well as ensuring that the structures are actually constructed as designed.

Therefore, this book primarily attempts to clarify all these issues (from Chapter 1 to 4) for European practising engineers, working in consultancy firms and construction companies. In addition, the examples of real buildings (see Chapter 9) are an added value, highlighting practical and real difficulties related to both design and execution.

This design manual is also meant as a recommended textbook for several existing courses given by the Structural Sections of Civil Engineering and Architectural Engineering Departments. In particular, this manual is oriented to advanced students (i.e. those attending MSc programmes) thanks to the presence of various calculation examples (see Chapter 6, 7 and 8) that simplify and speed up the understanding and the learning of seismic design of EC8 compliant steel structures. In addition, research students (i.e. those attending PhD programmes) can find useful insights for their experimental research activities by reading Chapter 5, which provides some guidance and discussion on how performing experimental tests of structural typologies and components in cyclic pseudo-static and dynamic conditions.
